**BASIC 8**

**WEEKLY LESSON PLAN – WEEK 4**

Strand:	Geometry and Measurement		Sub-Strand:	Equations and Inequalities	
Content Standard:	B8.3.1.1 Demonstrate understanding and use of the relationship between parallel lines and alternate and corresponding angles and use the sum of angles in a triangle to deduce the angle sum in any polygon				
Indicator (s)	B8.3.1.1.2 Determine the values of sum of given angles in a triangle using knowledge of the sum of interior angles in a triangle and other properties		Performance Indicator: Learners can add angles in a triangle.		
Week Ending	28-04-2023				
Class	B.S.8	Class Size:		Duration:	
Subject	Mathematics				
Reference	Mathematics Curriculum, Teachers Resource Pack, Learners Resource Pack, Textbook.				
Teaching / Learning Resources	Poster, Pictures, Word Chart.		Core Competencies:	<ul style="list-style-type: none"><li>Ability to select the most effective creative tools for working and preparedness to give explanations</li><li>Imagining and seeing things in a different way</li></ul>	
DAY/DATE	PHASE 1 : STARTER	PHASE 2: MAIN			PHASE 3: REFLECTION
MONDAY  24-04-2023	Review Learners knowledge on the previous lesson.	<div>1. Demonstrate finding for the sum of interior angles in a regular Polygon.</div> <div>2. Learners brainstorm to find the value of angles in a regular hexagon.</div> <div>3. Assist Learners to find the value of unknown variables in a regular hexagon.</div> <div>Steps to follow;</div> <div><div>○ Set up the formula for finding the sum of the interior angles. The formula is <math>\text{sum} = (n-2) \times 180</math>, where sum is the sum of the interior angles of the polygon, and 'n' equals the number of sides in the polygon</div></div>			Through questions and answers, conclude the lesson.  Exercise; <div><div>1. How do I calculate the number of sides of a polygon if the sum of the interior angles is 1080?</div><div>2. If two equilateral triangles are placed together to</div></div>

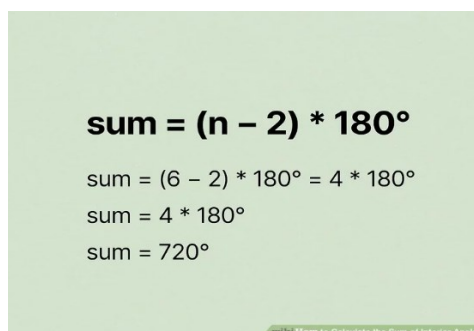

form a rhombus,  
how do I  
calculate the  
value of  
each interior  
angle of this  
rhombus,  
and how do  
I find the  
sum?

- Count the number of sides in your polygon

- Plug the value of 'n' into the formula

- Solve for 'n'.

### Example:

What is the Sum of the Interior Angles in a Hexagon?

### Solution:

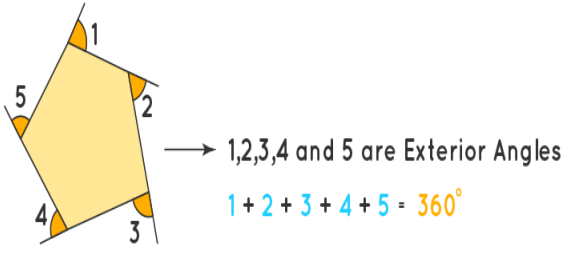

A hexagon has 6 sides, therefore, n = 6

The sum of interior angles of a regular polygon,  $S = (n - 2) \times 180$

$$S = (6 - 2) \times 180^\circ$$

$$\Rightarrow S = 4 \times 180$$

$$\Rightarrow S = 720^\circ$$

		<p>Therefore, the sum of interior angles of a hexagon is <math>720^\circ</math>.</p>	
<p><b>TUESDAY</b></p> <p><b>25-04-2023</b></p>	<p>Review Learners knowledge on the previous lesson.</p>	<ol style="list-style-type: none"> <li>1. Assist Learners to explain what an exterior angle is.</li> <li>2. Demonstrate calculating for the sum of an exterior angle of a polygon.</li> <li>3. Learners brainstorm to find for the sum of exterior angle of a Polygon.</li> </ol> <p><b>Sum of Exterior Angles of a Polygon</b> </p>  <p>The sum of the exterior angles of a polygon is equal to <math>360^\circ</math>. This can be proved with the following steps:</p> <ul style="list-style-type: none"> <li>• We know that the sum of the interior angles of a regular polygon with 'n' sides = <math>180(n-2)</math>.</li> <li>• The interior and exterior angle at each vertex form a linear pair. Therefore, there will be 'n' linear pairs in the polygon. Now, since each linear pair sums up to <math>180^\circ</math>, the sum of all linear pairs will be: <math>180n^\circ</math>.</li> <li>• So, the sum of exterior angles = Sum of all linear pairs - Sum of interior angles</li> <li>• This means: Sum of exterior angles = <math>180n - 180(n-2) = 180n - 180n + 360</math>. Hence, the sum of exterior angles of a pentagon equals <math>360^\circ</math>.</li> </ul>	<p>Reflect on finding for the sum of exterior angle of a polygon.</p> <p><b>Exercise;</b></p> <ol style="list-style-type: none"> <li>1. If the three interior angles of a quadrilateral are <math>96^\circ, 114^\circ</math>, and <math>41^\circ</math>, what is the measure of the fourth interior angle?</li> <li>2. The exterior angles of a regular pentagon are <math>y, 2y, 3y, 4y</math>, and <math>8y</math>. What is the size of the smallest interior angle of this pentagon?</li> </ol>

<b>THURSDAY</b> <b>27-04-2023</b>	Through questions and answers, review Learners knowledge on the previous lesson.	<ol style="list-style-type: none"> <li>1. Discuss with Learners how to calculate the number of sides of a polygon.</li> <li>2. Assist Learners to find the number of sides of polygons.</li> <li>3. Learners in small groups practice finding for the sum of interior and exterior angles when the number of sides of the Polygon is given.</li> </ol> <p>Question</p> <p>The interior angle of a regular polygon is <math>156^\circ</math>. Find the number of sides of the polygon</p> <p>Solution</p> <p>The interior angle of a regular polygon is 156 deg.  Hence each exterior angle is <math>180 - 156 = 24</math> deg.  So the polygon has <math>360/24 = 15</math> sides.</p>	Summarize the lesson. <b>Exercise;</b> <ol style="list-style-type: none"> <li>1. If the interior angle of a regular polygon is double the exterior angle, find the number of sides of polygon.</li> <li>2. If an exterior angle of a regular polygon is equal to its interior angle, find the number of sides in the polygon.</li> </ol> <p>An exterior angle and an interior angle of a regular polygon are in the ratio 2:7. Find the number of sides in the polygon.</p>
